1 Introduction

1.1 Overview

Note that this specification will be the standard Multicast Top specification to be used for the BZX, EDGX, and C2 Options Exchange platforms. This specification is for the Simple book only, refer to the [US Options Complex Multicast Top Specification](#) for Complex book information.

Options participants may use the Multicast Top protocol to receive real-time top of book quotations direct from each exchange. Market data received through Multicast Top is less timely than receiving the same data from the Multicast PITCH Depth of Book feed. The Top protocol offers a significant reduction in the number of events and number of bytes of application data sent, compared to the US Options Multicast PITCH protocol.

The quotations received via Multicast Top provide an aggregated size and do not indicate the size or number of individual orders at the best bid or ask. The Multicast Top protocol also provides last trade price and size and cumulative volume data.

Complete depth of book market data can be received via the US Options Multicast PITCH protocol.

Top cannot be used to enter orders. For order entry, refer to the appropriate US Options FIX or BOE Specification.

All versions of the Multicast Top feed will be Gig-shaped (maximum 1 Gb/s) and will be available from one or both of Cboe's datacenters. Participants may choose to take one or more of the following Multicast Top feeds depending on their location and connectivity to Cboe.

Multicast Top Feed Descriptions:

Exchange	Shaping	Served From Data Center (Primary/Secondary)	Multicast Feed ID
BZX Options	Gig	Primary	OAT
BZX Options	Gig	Primary	OBT
BZX Options	Gig	Secondary	OET
C2 Options	Gig	Primary	WAT
C2 Options	Gig	Primary	WBT
C2 Options	Gig	Secondary	WET
EDGX Options	Gig	Primary	EAT
EDGX Options	Gig	Primary	EBT
EDGX Options	Gig	Secondary	EET

1.2 Feed Connectivity Requirements

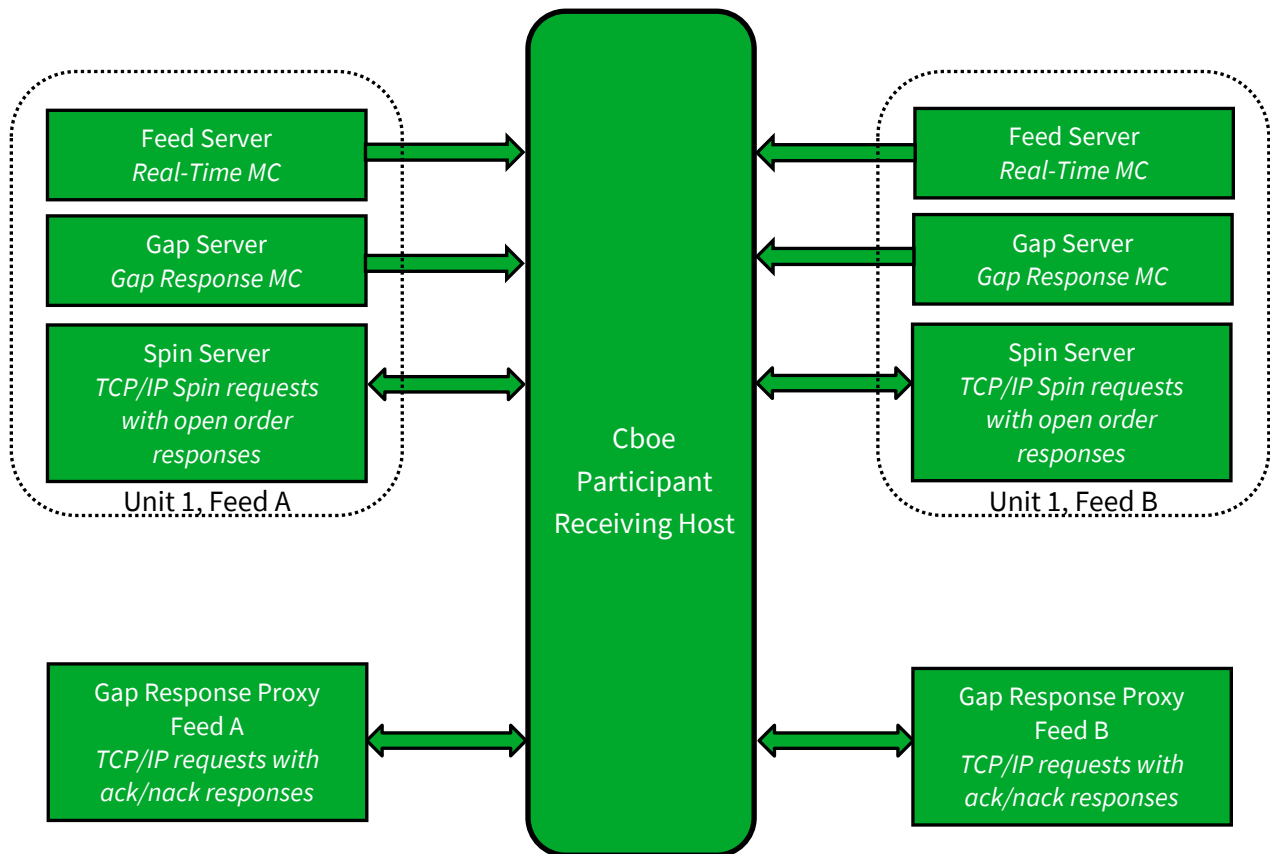

Gig-Shaped feeds are available to participants who meet the minimum bandwidth requirements to Cboe via cross-connect, dedicated circuit, or a supported carrier.

US Options Multicast Top
Specification (Version 1.1.9)

Participants with sufficient connectivity may choose to take both the A and B feeds from Cboe’s primary datacenter and arbitrate the feeds to recover lost data. Alternatively, participants may choose to arbitrate feeds from both datacenters. It should be noted that feeds from the secondary datacenter will have additional latency for those connected with Cboe in the primary datacenter due to proximity and business continuity processing.

Multicast Top real-time events are delivered using a published range of multicast addresses divided by symbol range units. Dropped messages can be requested using a TCP/IP connection to one of Cboe’s Multicast Top Gap Request Proxy (“GRP”) servers with replayed messages being delivered on a separate set of multicast ranges reserved for packet retransmission. Intraday, a spin of current top of book may be requested from a Spin Server.

The following diagram is a logical representation Multicast Top feed message flow between Cboe and a participant feed handler that is listening to the “A” and “B” instances of two units:

1.3 Symbol Ranges, Units, and Sequence Numbers

Symbols will be separated into units and [symbol distribution](#) will not change intra-day. Cboe does, however, **reserve the right to add multicast addresses or change the symbol distribution with 48 hours prior notice to participants**. Care should be taken to ensure that address changes, address additions, and symbol distribution changes can be supported easily.

Message sequence numbers are incremented by one for every sequenced message within a particular symbol unit. It is important to understand that one *or more* units will be delivered on a single multicast address. As with symbol ranges, unit distribution across multicast addresses will not change intra-day, but may change after notice has been given.

Symbol distribution across units as well as unit distribution across multicast addresses are identical for real-time and gap response multicast addresses.

1.4 Options Specific Symbol Processing

Cboe has implemented a symbol mapping mechanism (`Symbol Mapping` message) for the Multicast Top feeds, which maps each specific simple options contract to a six character, ASCII *Symbol*. This symbol mapping significantly reduces the size of the Multicast Top feed and allows participants to use the same symbol handling mechanisms for the Cboe operated equity, options, and futures exchanges. This symbol mapping is the same as the US Options Multicast PITCH feed.

Mapping occurs on a continuous basis on each unit's multicast feed. `Symbol Mapping` messages will be un-sequenced and are sent from pre-market through the end of trading. The rate is variable and will be adjusted as bandwidth allows. Once the same contract has been seen twice, the user can be certain the full loop has been observed. The rate is variable and will be adjusted as bandwidth allows.

In addition to the symbol mapping events available on the Multicast Top feed, a downloadable file with current mappings is available via the Cboe website.

1.5 Gap Request Proxy and Message Retransmission

Requesting delivery of missed sequenced data is achieved by establishing a TCP connection to a Gap Request Proxy ("GRP") port. This GRP port is specific to Multicast Top and is NOT shared with the Multicast PITCH GRP port. Participants who do not wish to request missed messages do not need to connect to a GRP port for any reason or listen to the multicast addresses reserved for message retransmission. Participants choosing to request missed data will need to connect to their assigned GRP port, log in, and request gap ranges as necessary. All gap requests will be responded to with a `Gap Response` message. A `Gap Response Status` code of 'A' accepted signals that the replayed messages will be delivered via the appropriate gap response multicast address. Any other `Gap Response Status` code will indicate the reason that the request cannot be serviced.

US Options Multicast Top Specification (Version 1.1.9)

Gap requests are limited in message count, frequency, and age by the GRP. Gap requests will only be serviced if they are within a defined sequence range of the current multicast sequence number for the requested unit. Participants will receive a total daily allowance of gap requested messages. In addition, each participant is given renewable one second and one minute gap request limits.

If more than one gap request is received for a particular unit/sequence/count combination within a short timeframe, all requests will receive a successful `Gap Response` message from the GRP, but only a single replayed message will be sent on the gap response multicast address.

If overlapping gap requests are received within a short period of time, the gap server will only send the union of the sequence ranges across grouped gap requests. Participants will receive gap responses for their requested unit/sequence/count, but receivers should be prepared for the **gap responses to be delivered via multicast in non-contiguous blocks**.

Gap acknowledgements or rejects will be delivered to users for every gap request received by the GRP. Users should be prepared to see replayed multicast data before or after the receipt of the gap response acknowledgement from the GRP.

1.6 Spin Servers

A Spin Server is available for each unit. The server allows participants to connect via TCP and receive a spin of the inside book and symbols with limited trading conditions on that unit. By using the spin, a participant can get the current book quickly in the middle of the trading session without worry of gap request limits. The Spin Server for each unit is assigned its own address and/or TCP port.

Upon successful login and periodically thereafter, a `Spin Image Available` message is sent which contains a sequence number indicating the most recent message applied to the book. Using a `Spin Request` message, a participant may request a spin for the orders up to a sequence number noted within one of the *last ten* `Spin Image Available` messages distributed. If the `Spin Request` submitted does not present a sequence number that matches one of the last ten `Spin Image Available` messages distributed, the spin will return orders up to the next closest sequence number reported through a `Spin Image Available` message that is greater than the sequence number requested.

In the case a participant sends a sequence number in a `Spin Request` that is higher than the sequence number reported by the most recent `Spin Image Available` message, the next spin image to be generated will be returned when it is available. If the requested sequence number is still higher at that time, an "O" (Out of Range) error will be generated.

A spin consists only of `Market Snapshot` and `Time` messages for symbols that have had orders that day or had a limited trading state. While receiving the spin, the participant must buffer multicast messages received. If the `Spin Image Available` message sequence number is the participant's reference point, multicast messages with larger sequence numbers should be buffered. If a non-`Spin`

US Options Multicast Top
Specification (Version 1.1.9)

Image Available sequence number is the participant's reference point which they send in their Spin Request, they should buffer from that point on, but note that within the spin they may receive sequence numbers beyond that point which they may disregard. When a Spin Finished message is received, the buffered messages must be applied to spun copy of the book to bring it current.

[Section 5.7](#) shows an example flow of messages between a participant and Cboe's Multicast Top feed and Spin Server.

2 Protocol

Cboe users may use the Top protocol over multicast to receive real-time top of book quotations and execution information direct from Cboe.

Top cannot be used to enter orders. For order entry, refer to the US Options FIX or BOE Specification.

2.1 Message Format

The messages that make up the Top protocol are delivered using `Sequenced Unit Header` which handles sequencing and delivery integrity. All messages delivered via multicast as well as to/from the Gap Request Proxy (“GRP”) or Spin Server will use the `Sequenced Unit Header` for handling message integrity.

All UDP delivered events will be self-contained. Developers can assume that UDP delivered data will not cross frame boundaries and a single Ethernet frame will contain only one `Sequenced Unit Header` with associated data.

TCP/IP delivered events from the GRP may cross frames as the data will be delivered as a stream of data with the TCP/IP stack controlling Ethernet framing.

The Top data feed is comprised of a series of dynamic length sequenced messages. Each message begins with `Length` and `Message Type` fields. **Cboe reserves the right to add message types and grow the length** of any message without notice. Participants should develop their decoders to deal with unknown message types and messages that grow beyond the expected length. Messages will only be grown to add additional data to the end of a message.

2.2 Data Types

The following field types are used within the `Sequenced Unit Header`, GRP messages, and Top.

- **Alphanumeric** fields are left justified ASCII fields and space padded on the right.
- **Binary** fields are unsigned and sized to “Length” bytes and ordered using Little Endian convention (least significant byte first).
- **Signed Binary** fields are signed and sized to “Length” bytes and ordered using Little Endian convention (least significant byte first).
- **Binary Price** fields are unsigned Little Endian encoded 8 byte binary fields with 4 implied decimal places (denominator = 10,000).
- **Binary Short Price** fields are unsigned Little Endian encoded 2 byte binary fields with 2 implied decimal places (denominator = 100).

- **Bit Field** fields are fixed width fields with each bit representing a Boolean flag (the 0 bit is the lowest significant bit; the 7 bit is the highest significant bit).
- **Printable ASCII** fields are left justified ASCII fields that are space padded on the right that may include ASCII values in the range of 0x20 – 0x7e.
- **Time Offset** are 4 byte unsigned Little Endian values that represent the number of nanoseconds since the last `Time` message.

2.3 Message Framing

Top of book update messages will be combined into single UDP frame where possible to decrease message overhead and total bandwidth. The count of messages in a UDP frame will be communicated using the `Sequenced Unit Header`. Framing will be determined by the server for each unit and site. The content of the multicast across feeds (e.g. A/B) will be identical, but framing will not be consistent across feeds. Receiving processes that receive and arbitrate multiple feeds cannot use frame level arbitration to fill gaps.

2.4 Sequenced Unit Header

The `Sequenced Unit Header` is used for all Multicast Top messages as well as messages to and from the Gap Request Proxy (“GRP”) and Spin Servers.

Sequenced and un-sequenced data may be delivered using the `Sequenced Unit Header`. Un-sequenced headers will have a 0 value for the `Hdr Sequence` field and potentially for the `Hdr Unit` field. All messages sent to and from the GRP and Spin Server are un-sequenced while multicast may contain both sequenced and un-sequenced messages.

Sequenced messages have implied sequences with the first message having the sequence number contained in the header. Each subsequent message will have an implied sequence one greater than the previous message up to a maximum of count messages. Multiple messages can follow a `Sequenced Unit Header`, but a combination of sequenced and un-sequenced messages cannot be sent within one header.

The sequence number for the first message in the next frame can be calculated by adding the `Hdr Count` field to the `Hdr Sequence`. This technique will work for sequenced messages and `Heartbeats`.

Sequenced Unit Header				
Field	Offset	Length	Value/Type	Description
<code>Hdr Length</code>	0	2	Binary	Length of entire block of messages. Includes this header and <code>Hdr Count</code> messages to follow.
<code>Hdr Count</code>	2	1	Binary	Number of messages to follow this header.
<code>Hdr Unit</code>	3	1	Binary	Unit that applies to messages included in this header.

US Options Multicast Top
Specification (Version 1.1.9)

<i>Hdr Sequence</i>	4	4	Binary	Sequence of first message to follow this header.
Total Length = 8 bytes				

2.5 Heartbeat Messages

The *Sequenced Unit Header* with a count field set to “0” will be used for *Heartbeat* messages. During trading hours *Heartbeat* messages will be sent from the GRP, Spin Server, and all multicast addresses if no data has been delivered within one second. *Heartbeat* messages never increment the sequence number for a unit, but can be used to detect gaps on the real-time multicast channels during low update rate periods.

Heartbeats on the real-time multicast addresses during trading hours will have an *Hdr Sequence* value equal to the sequence of the next sequenced message to be sent for the unit. *Heartbeats* on gap multicast addresses will always have the *Hdr Sequence* field set to 0. All *Heartbeat* messages sent to and from the GRP and Spin Server are considered un-sequenced and should have sequence and unit fields set to 0.

Outside of trading hours Cboe sends *Heartbeat* messages on all real-time and gap channels with a sequence of “0” to help users validate multicast connectivity. *Heartbeat* messages might not be sent outside of normal trading hours.

Cboe expects *Heartbeat* messages to be sent to the GRP on live connections no less than every 5 seconds. Failure to receive two consecutive *Heartbeat* messages will result in the GRP or Spin Server terminating the client connection.

3 Top Messages

With the exception of `Time` messages, each Top message reflects the update of the top of book or execution of an order in the system.

3.1 Time

A `Time` message is sent whenever the source time for a unit passes over a second boundary. All subsequent time offset fields for the same unit will use the new `Time` value as the base until another `Time` message is received for the same unit. The `Time` field is the number of seconds relative to midnight Eastern Time, which is provided in the `Time Reference` message.

Time				
Field Name	Offset	Length	Type/(Value)	Description
<i>Length</i>	0	1	Binary	<i>Length</i> of this message including this field.
<i>Message Type</i>	1	1	0x20	Time Message
<i>Time</i>	2	4	Binary	Number of whole seconds from midnight Eastern Time.
Total Length = 6 bytes				

3.2 Unit Clear

The `Unit Clear` message instructs feed recipients to clear all market snapshots for the book in the unit specified in the `Sequenced Unit Header`. This message will be sent at startup each day. It would also be distributed in certain recovery events such as a data center fail-over.

Unit Clear				
Field Name	Offset	Length	Type/(Value)	Description
<i>Length</i>	0	1	Binary	<i>Length</i> of this message including this field.
<i>Message Type</i>	1	1	0x97	Unit Clear Message
<i>Time Offset</i>	2	4	Binary	Nanosecond offset from last unit timestamp.
Total Length = 6 bytes				

3.3 Symbol Mapping

The `Symbol Mapping` message are sent as an unsequenced message. One unsequenced `Symbol Mapping` message for each `Symbol` are sent in a continuous loop as bandwidth allows.

Members who consume the 5G-Shaped Multicast PITCH feeds will be able to receive the full list of symbols in approximately 5 minutes, and will allow for optimal distribution in situations where market data is susceptible to throttling as a result of high message burst rates. All 1 Gigabit-Shaped (“1G-Shaped”) feeds will continue to complete the full loop of `Symbol Mapping` messages in approximately 30 minutes.

US Options Multicast Top
Specification (Version 1.1.9)

Symbol Mapping				
Field Name	Offset	Length	Type/(Value)	Description
<i>Length</i>	0	1	Binary	<i>Length</i> of this message including this field.
<i>Message Type</i>	1	1	0x2E	Symbol Mapping Message
<i>Feed Symbol</i>	2	6	Printable ASCII	<i>Symbol</i> right padded with spaces.
<i>OSI Symbol</i>	8	21	Printable ASCII	OSI Symbol
<i>Symbol Condition</i>	29	1	Alphanumeric	N = Normal C = Closing Only
Total Length = 30 bytes				

3.4 Refresh and Spin Messages

3.4.1 Market Snapshot

A *Market Snapshot* message provides a snapshot of the price and size for the bid and ask, last trade price, total number of contracts traded, and the current trading status of a single symbol. The *Market Snapshot* message will be included during a Spin for all symbols traded so far this trading session.

The *Unit Timestamp* field is provided because the timestamp for a *Market Snapshot* is the last time an event occurred on that *Symbol*.

The *Market Snapshot* message comes in two variants: *Market Snapshot (Long)* and *Market Snapshot (Short)*. The *Market Snapshot (Short)* is used whenever possible, but the *Market Snapshot (Long)* version is used if any of the *Price* fields cannot be represented by a Binary Short Price (\$0.00 to \$655.36) or any of the *Quantity* fields cannot be represented by an unsigned 16-bit value (65536).

Market Snapshot (Short)				
Field Name	Offset	Length	Type/(Value)	Description
<i>Length</i>	0	1	Binary	<i>Length</i> of this message including this field.
<i>Message Type</i>	1	1	0xB2	<i>Market Snapshot (Short)</i> Message
<i>Time Offset</i>	2	4	Binary	Nanosecond offset from <i>Unit Timestamp</i> in this message.
<i>Symbol</i>	6	6	Printable ASCII	<i>Symbol</i> right padded with spaces.
<i>Unit Timestamp</i>	12	4	Binary	Last unit timestamp expressed as number of whole seconds since the Epoch (Midnight, January 1, 1970 UTC).
<i>Bid Price</i>	16	2	Binary Short Price	Bid price
<i>Bid Quantity</i>	18	2	Binary	Number of contracts on the bid side of the inside book (a zero value denotes there is no <i>Bid</i>).

US Options Multicast Top
Specification (Version 1.1.9)

<i>Ask Price</i>	20	2	Binary Short Price	Ask price
<i>Ask Quantity</i>	22	2	Binary	Number of contracts on the ask side of the inside book (a zero value denotes there is no Ask).
<i>Last Trade Price</i>	24	2	Binary Short Price	Price of last execution
<i>Last Trade Size</i>	26	2	Binary	Number of contracts traded on the last trade (if this value is 0 the <i>Last Trade Price</i> is invalid).
<i>Last Trade Condition</i>	28	1	Alphanumeric	Trade Condition for Last Trade (Space): Normal Trade S: Spread Trade X: Trade Break
<i>Total Volume</i>	29	4	Binary	Total number of contracts traded on the current trading session.
<i>Trading Status</i>	33	1	Alphanumeric	See <i>Trading Status</i> field of Trading Status message.
<i>Reserved</i>	34	3	Alphanumeric	Reserved for use in other markets.
<i>Bit Fields</i>	37	1	Bit Field	Customer bits set on BZX and EDGX only. Will always be zero for C2 (effective 8/31/18). Bit 0: Reserved Bit 1: If set, bid has customer orders Bit 2: If set, ask has customer orders
Total Length = 38 bytes				

Market Snapshot (Long)				
Field Name	Offset	Length	Type/(Value)	Description
<i>Length</i>	0	1	Binary	<i>Length</i> of this message including this field.
<i>Message Type</i>	1	1	0xB3	Market Snapshot (Long) Message
<i>Time Offset</i>	2	4	Binary	Nanosecond offset from <i>Unit Timestamp</i> in this message.
<i>Symbol</i>	6	6	Printable ASCII	<i>Symbol</i> right padded with spaces.
<i>Unit Timestamp</i>	12	4	Binary	Last unit timestamp expressed as number of whole seconds since the Epoch (Midnight, January 1, 1970 UTC).
<i>Bid Price</i>	16	8	Binary Price	Bid price
<i>Bid Quantity</i>	24	4	Binary	Number of contracts on the bid side of the inside book (a zero value denotes there is no <i>Bid</i>).
<i>Ask Price</i>	28	8	Binary Price	Ask price
<i>Ask Quantity</i>	36	4	Binary	Number of contracts on the ask side of the inside book (a zero value denotes there is no Ask).

US Options Multicast Top
Specification (Version 1.1.9)

<i>Last Trade Price</i>	40	8	Binary Price	Price of last execution
<i>Last Trade Size</i>	48	4	Binary	Number of contracts traded on the last trade (if this value is 0 the <i>Last Trade Price</i> is invalid).
<i>Last Trade Condition</i>	52	1	Alphanumeric	Trade Condition for Last Trade (Space): Normal Trade S: Spread Trade X: Trade Break
<i>Total Volume</i>	53	4	Binary	Total number of contracts traded on the current trading session.
<i>Trading Status</i>	57	1	Alphanumeric	See <i>Trading Status</i> field of Trading Status message.
<i>Reserved</i>	58	3	Alphanumeric	Reserved for use in other markets.
<i>Bit Fields</i>	61	1	Bit Field	Customer bits set on BZX and EDGX only. Will always be zero for C2 (effective 8/31/18). Bit 0: Reserved Bit 1: If set, bid has customer orders Bit 2: If set, ask has customer orders
Total Length = 62 bytes				

3.5 Market Update Messages

Market Update messages reflect real-time events to the current state of the market. These messages are always sequenced and may be recovered via the Gap Request Proxy (“GRP”).

3.5.1 Single Side Update

Single Side Update messages provide an updated price and size for a single side of a *Symbol*. The side is denoted by the *Side* field. One Single Side Update message may reflect one or more updates to the inside book that were processed at the same time, but will only be done so in a way that can be arbitrated between A/B feeds.

Single Side Update messages come in two variants: Single Side Update (Long) and Single Side Update (Short). The Single Side Update (Short) message is used whenever possible, but the Single Side Update (Long) message is used whenever the *Price* cannot be represented by a Binary Short Price or the *Quantity* cannot be represented by an unsigned 16-bit integer.

Only the Customer bit in *Bit Fields* matching the *Side* field is valid. For example, if *Side* is B (bid), then only Bit 1 is valid. The value of Bit 2 may not be used (regardless of value).

Single Side Update (Short)				
Field Name	Offset	Length	Type/(Value)	Description
<i>Length</i>	0	1	Binary	<i>Length</i> of this message including this field.

US Options Multicast Top
Specification (Version 1.1.9)

<i>Message Type</i>	1	1	0xB4	Single Side Update (Short) Message
<i>Time Offset</i>	2	4	Binary	Nanosecond offset from last unit timestamp.
<i>Symbol</i>	6	6	Printable ASCII	<i>Symbol</i> right padded with spaces.
<i>Side</i>	12	1	Alphanumeric	B = Bid Side S = Ask Side
<i>Price</i>	13	2	Binary Short Price	Price
<i>Quantity</i>	15	2	Binary	Number of contracts on the inside book (a zero value denotes there is no <i>Bid/Ask</i>).
<i>Bit Fields</i>	17	1	Bit Field	Customer bits set on BZX and EDGX only. Will always be zero for C2 (effective 8/31/18). Bit 0: Reserved Bit 1: If set, bid has customer orders (if <i>Side</i> = B) Bit 2: If set, ask has customer orders (if <i>Side</i> = S)
Total Length = 18 bytes				

Single Side Update (Long)				
Field Name	Offset	Length	Type/(Value)	Description
<i>Length</i>	0	1	Binary	<i>Length</i> of this message including this field.
<i>Message Type</i>	1	1	0xB5	Single Side Update (Long) Message
<i>Time Offset</i>	2	4	Binary	Nanosecond offset from last unit timestamp.
<i>Symbol</i>	6	6	Printable ASCII	<i>Symbol</i> right padded with spaces.
<i>Side</i>	12	1	Alphanumeric	B = Bid Side S = Ask Side
<i>Price</i>	13	8	Binary Price	Price
<i>Quantity</i>	21	4	Binary	Number of contracts on the inside book (a zero value denotes there is no <i>Bid/Ask</i>).
<i>Bit Fields</i>	25	1	Bit Field	Customer bits set on BZX and EDGX only. Will always be zero for C2 (effective 8/31/18). Bit 0: Reserved Bit 1: If set, bid has customer orders (if <i>Side</i> = B). Bit 2: If set, ask has customer orders (if <i>Side</i> = S)
Total Length = 26 bytes				

3.5.2 Two Side Update Message

US Options Multicast Top
Specification (Version 1.1.9)

Two Side Update messages provide an updated price and size for both sides of a *Symbol*. One Two Side Update message may reflect one or more updates to the inside book that were processed at the same time, but will only be done so in a way that can be arbitrated between A/B feeds.

Two Side Update messages come in two variants: Two Side Update (Long) and Two Side Update (Short). The Two Side Update (Short) message is used whenever possible, but the Two Side Update (Long) message is used whenever the *Price* cannot be represented by a Binary Short Price or the *Quantity* cannot be represented by an unsigned 16-bit integer.

Both Bit 1 and Bit 2 in the *Bit Fields* are valid in this message.

Two Side Update (Short)				
Field Name	Offset	Length	Type/(Value)	Description
<i>Length</i>	0	1	Binary	<i>Length</i> of this message including this field.
<i>Message Type</i>	1	1	0xB6	Two Side Update (Short) Message
<i>Time Offset</i>	2	4	Binary	Nanosecond offset from <i>Unit Timestamp</i> in this message.
<i>Symbol</i>	6	6	Printable ASCII	<i>Symbol</i> right padded with spaces.
<i>Bid Price</i>	12	2	Binary Short Price	Bid price
<i>Bid Quantity</i>	14	2	Binary	Number of contracts on the bid side of the inside book (a zero value denotes there is no <i>Bid</i>).
<i>Ask Price</i>	16	2	Binary Short Price	Ask price
<i>Ask Quantity</i>	18	2	Binary	Number of contracts on the ask side of the inside book (a zero value denotes there is no <i>Ask</i>).
<i>Bit Fields</i>	20	1	Bit Field	Customer bits set on BZX and EDGX only. Will always be zero for C2 (effective 8/31/18). Bit 0: Reserved Bit 1: If set, bid has customer orders Bit 2: If set, ask has customer orders
Total Length = 21 bytes				

Two Side Update (Long)				
Field Name	Offset	Length	Type/(Value)	Description
<i>Length</i>	0	1	Binary	<i>Length</i> of this message including this field.
<i>Message Type</i>	1	1	0xB7	Two Side Update (Long) Message
<i>Time Offset</i>	2	4	Binary	Nanosecond offset from <i>Unit Timestamp</i> in this message.
<i>Symbol</i>	6	6	Printable ASCII	<i>Symbol</i> right padded with spaces.
<i>Bid Price</i>	12	8	Binary Price	Bid price

US Options Multicast Top
Specification (Version 1.1.9)

<i>Bid Quantity</i>	20	4	Binary	Number of contracts on the bid side of the inside book (a zero value denotes there is no <i>Bid</i>).
<i>Ask Price</i>	24	8	Binary Price	Ask price
<i>Ask Quantity</i>	32	4	Binary	Number of contracts on the ask side of the inside book (a zero value denotes there is no <i>Ask</i>).
<i>Bit Fields</i>	36	1	Bit Field	Customer bits set on BZX and EDGX only. Will always be zero for C2 (effective 8/31/18). Bit 0: Reserved Bit 1: If set, bid has customer orders Bit 2: If set, ask has customer orders
Total Length = 37 bytes				

3.5.3 Top Trade Message

The Top Trade message provides information about executions of orders on the book. Top Trade messages are necessary to calculate execution-based data. Top Trade messages do not alter the book. One or more Single Side Update or Two Side Update messages will follow a Top Trade message to reflect the updated book (for example, an aggressive order may take out one or more price levels and establish a new level on the opposite side).

Any order may be executed in parts. A complete view of all executions can be built from all Top Trade messages.

The Top Trade message sends the trade price, trade quantity, execution id, and trade condition of a trade as well as the cumulative volume for the trading session. A Top Trade message will be sent for each execution, but not every Top Trade message indicates a trade. The *Trade Condition* value of 'X' (Trade Break) is sent whenever an execution is broken. Trade breaks will contain the *Symbol*, *Quantity*, *Price*, and *Execution Id* of the original trade. The *Total Volume* field will be reduced by the number of shares reported in the *Quantity* field.

Top Trade				
Field Name	Offset	Length	Type/(Value)	Description
<i>Length</i>	0	1	Binary	<i>Length</i> of this message including this field.
<i>Message Type</i>	1	1	0xB8	Top Trade Message
<i>Time Offset</i>	2	4	Binary	Nanosecond offset from last unit timestamp.
<i>Symbol</i>	6	6	Printable ASCII	<i>Symbol</i> right padded with spaces.
<i>Quantity</i>	12	4	Binary	Incremental number of contracts executed or corrected (see <i>Trade Condition</i>).
<i>Price</i>	16	8	Binary Price	The execution price of the order.

US Options Multicast Top
Specification (Version 1.1.9)

<i>Execution Id</i>	24	8	Binary	Cboe generated day-unique execution identifier of this trade. <i>Execution Id</i> is also referenced in the <i>Trade Break</i> message.
<i>Total Volume</i>	32	4	Binary	Total number of contracts traded on the current trading session (may decrease if the <i>Trade Condition</i> field indicates a canceled trade).
<i>Trade Condition</i>	36	1	Alphanumeric	(Space) : Normal Trade S: Spread Trade X: Trade Break
Total Length = 37 bytes				

3.6 Trading Status

The *Trading Status* message is used to indicate the current trading status of an options contract. A *Trading Status* message will be sent whenever a security's trading status changes. The following summarizes the *Trading Status* values in the Cboe system:

- H = Halt state.
- Q = Queuing. Sent starting at 7:30AM ET once orders can be accepted for queuing in preparation for the market open.
- S = Suspended. Implied at system startup for all series.
- T = Trading. Sent when symbol is open for trading, sometime after 9:30AM ET.

A *Trading Status* message will also be sent:

- For a Regulatory Halt "Q"ueuing Period in any symbol where the underlying has experienced a Regulatory Halt as well as the "T"rading resumption for the same instrument.
- In the event of an Exchange specific "S"uspension.

Trading Status				
Field Name	Offset	Length	Type/(Value)	Description
<i>Length</i>	0	1	Binary	Length of this message including this field.
<i>Message Type</i>	1	1	0x31	<i>Trading Status</i> message
<i>Time Offset</i>	2	4	Binary	Nanosecond offset from last unit timestamp.
<i>Symbol</i>	6	6	Printable ASCII	<i>Symbol</i> right padded with spaces.
<i>Reserved</i>	12	2	Alpha	Reserved
<i>Trading Status</i>	14	1	Alpha	H = Halted Q = Queuing S = Exchange Specific Suspension T = Trading
<i>Reserved</i>	15	3	Alphanumeric	Reserved
Total Length = 18 bytes				

3.7 End of Session

The `End of Session` message is sent for each unit when the unit shuts down. No more sequenced messages will be delivered for this unit, but heartbeats from the unit may be received.

End of Session				
Field Name	Offset	Length	Type/(Value)	Description
<i>Length</i>	0	1	Binary	<i>Length</i> of this message including this field.
<i>Message Type</i>	1	1	0x2D	End of Session Message
<i>Timestamp</i>	2	4	Binary	Nanosecond offset from last unit timestamp.
Total Length = 6 bytes				

4 Gap Request Proxy Messages

The following messages are used for initializing a TCP/IP connection to the Gap Request Proxy (“GRP”) and to request message retransmissions. Participants only need to implement the following messages if gap requests will be made. The following messages will not be delivered using multicast.

4.1 Login

The `Login` message is the first message sent to the GRP by a user’s process after the connection to the GRP is established. Failure to login before sending any other message type will result in the connection being dropped by the GRP.

Login				
Field	Offset	Length	Value/Type	Description
<i>Length</i>	0	1	Binary	<i>Length</i> of this message including this field.
<i>Message Type</i>	1	1	0x01	Login Message
<i>SessionSubId</i>	2	4	Alphanumeric	<i>SessionSubId</i> supplied by Cboe.
<i>Username</i>	6	4	Alphanumeric	<i>Username</i> supplied by Cboe.
<i>Filler</i>	10	2	Alphanumeric	(space filled)
<i>Password</i>	12	10	Alphanumeric	<i>Password</i> supplied by Cboe.
Total Length = 22 bytes				

4.2 Login Response

The `Login Response` message is sent by the GRP to a user’s process in response to a `Login` message. The status field is used to reflect an accepted login or the reason the session was not accepted. If login fails, the connection will be dropped after the `Login Response` message is sent.

Login Response				
Field	Offset	Length	Value/Type	Description
<i>Length</i>	0	1	Binary	<i>Length</i> of this message including this field.

US Options Multicast Top
Specification (Version 1.1.9)

<i>Message Type</i>	1	1	0x02	Login Response Message
<i>Status</i>	2	1	Alphanumeric	Accepted or reason for reject.
Total Length = 3 bytes				
Login Response - Status Codes				
'A'	Login Accepted			
'N'	Not authorized (Invalid Username/Password)			
'B'	Session in use			
'S'	Invalid Session			

4.3 Gap Request

The `Gap Request` message is used by a user's process to request retransmission of a sequenced message (or messages) by one of Cboe's gap servers.

Gap Request				
Field	Offset	Length	Value/Type	Description
<i>Length</i>	0	1	Binary	<i>Length</i> of this message including this field.
<i>Message Type</i>	1	1	0x03	Gap Request Message
<i>Unit</i>	2	1	Binary	<i>Unit</i> that the gap is requested for.
<i>Sequence</i>	3	4	Binary	<i>Sequence</i> of first message (lowest sequence in range).
<i>Count</i>	7	2	Binary	<i>Count</i> of messages requested.
Total Length = 9 bytes				

4.4 Gap Response

The `Gap Response` message is sent by the GRP in response to a `Gap Request` message. The *Unit* and *Sequence* fields will match the values supplied in the `Gap Request` message. A `Gap Response` message, with a Status of Accepted or reason for failure, will be sent for each `Gap Request` message received by the GRP.

Gap Response				
Field	Offset	Length	Value/Type	Description
<i>Length</i>	0	1	Binary	<i>Length</i> of this message including this field.
<i>Message Type</i>	1	1	0x04	Gap Response Message
<i>Unit</i>	2	1	Binary	<i>Unit</i> the gap was requested for.
<i>Sequence</i>	3	4	Binary	<i>Sequence</i> of first message in request.
<i>Count</i>	7	2	Binary	<i>Count</i> of messages requested.
<i>Status</i>	9	1	Alphanumeric	Accepted or reason for reject*.
Total Length = 10 bytes				
Gap Response - Status Codes				
'A'	Accepted			
'O'	Out of range (ahead of sequence or too far behind)			
'D'	Daily gap request allocation exhausted			
'M'	Minute gap request allocation exhausted			
'S'	Second gap request allocation exhausted			
'C'	Count request limit for one gap request exceeded			
'I'	Invalid Unit specified in request			
'U'	Unit is currently unavailable			

* - All non-'A' status codes should be interpreted as a reject.

5 Spin Messages

5.1 Login

The `Login` message is the first message sent to the Spin Server by a user's process after the connection to the Spin Server is established. Failure to login before sending any other message type will result in the connection being dropped by the Spin Server.

The format of the `Login` message for the Spin Server is identical to that of the GRP described previously in [Section 4.1](#).

5.2 Login Response

The `Login Response` message is sent by the Spin Server to a user's process in response to a `Login` message. The status field is used to reflect an accepted login or the reason the session was not accepted. If login fails, the connection will be dropped after the `Login Response` message is sent.

The format of the `Login Response` message for the Spin Server is identical to that of the GRP described previously in [Section 4.2](#).

5.3 Spin Image Available

The `Spin Image Available` message is sent once per second and indicates through what sequence number a spin is available.

Spin Image Available				
Field Name	Offset	Length	Type/(Value)	Description
<i>Length</i>	0	1	Binary	<i>Length</i> of this message including this field.
<i>Message Type</i>	1	1	0x80	Spin Image Available Message
<i>Sequence</i>	2	4	Binary	Spin is available which is current through this sequence number.
Total Length = 6 bytes				

5.4 Spin Request

The `Spin Request` message is used by a user's process to request transmission of a spin of the unit's order book. Refer to [Section 1.6](#) for more complete details regarding *Sequence* specification as well as buffering requirements.

Spin Request				
Field Name	Offset	Length	Type/(Value)	Description
<i>Length</i>	0	1	Binary	<i>Length</i> of this message including this field.
<i>Message Type</i>	1	1	0x81	Spin Request Message
<i>Sequence</i>	2	4	Binary	Sequence number from a <code>Spin Image Available</code> message received by the participant.
Total Length = 6 bytes				

5.5 Spin Response

The *Spin Response* message is sent in response to a user's *Spin Request* message indicating whether a spin will be sent.

Spin Response				
Field Name	Offset	Length	Type/(Value)	Description
<i>Length</i>	0	1	Binary	<i>Length</i> of this message including this field.
<i>Message Type</i>	1	1	0x82	<i>Spin Response</i> Message
<i>Sequence</i>	2	4	Binary	Sequence number from a <i>Spin Image</i> Available message received by the participant.
<i>Order Count</i>	6	4	Binary	Always zero.
<i>Status</i>	10	1	Alphanumeric	Accepted or reason for reject*.
Total Length = 11 bytes				
Spin Response - Status Codes				
'A'	Accepted			
'O'	Out of Range (<i>Sequence</i> requested is greater than <i>Sequence</i> available by the next spin)			
'S'	Spin already in progress (only one spin can be running at a time).			

* - All non-'A' status codes should be interpreted as a reject.

5.6 Spin Finished

The *Spin Finished* message is sent to indicate that all messages for the spin requested have been sent. A *Spin Finished* message is only sent if a *Spin Request* was not rejected. Upon receipt of a *Spin Finished* message, any buffered multicast messages should be applied to the participant's copy of the book to make it current.

Spin Finished				
Field Name	Offset	Length	Type/(Value)	Description
<i>Length</i>	0	1	Binary	<i>Length</i> of this message including this field.
<i>Message Type</i>	1	1	0x83	<i>Spin Finished</i> Message
<i>Sequence</i>	2	4	Binary	Sequence number from the <i>Spin Request</i> message.
Total Length = 6 bytes				

5.7 Spin Server Usage Example

The following diagram (see next page) shows the exchange of messages over time between a participant and Cboe's Multicast Top feed and Spin Server. `Time` messages may be found mixed between `Market Snapshot` messages according to their timestamps.

At time 1, the participant has no state of the book and desires to become current. The participant caches the received Multicast Top messages (sequences 310172 and 310173) for later use. Since the participant has no book, they cannot yet be applied.

At time 5, the participant has successfully logged into the Spin Server and has cached another message, sequence 310174.

At time 7, the participant receives a `Spin Image Available` message which indicates that the spin server is capable of giving them a spin of all symbols as of sequence 310169. The participant does not have all messages cached after 310169 (they are missing 310170 and 310171), so this spin is not useful to the participant.

At time 10, the participant receives a `Spin Image Available` message which is useful since it would be a spin of all orders up to and including sequence 310175 and the participant has all messages after 310175 cached.

At time 11, the participant sends a `Spin Request` for all messages up to and including 310175 and continues to cache Multicast Top messages received.

At time 14, the Spin Server acknowledges the `Spin Request` and indicates that three symbols will be sent.

At time 24, the spin server indicates that it has finished sending all open orders. The participant must then apply the cached messages from sequence number 310176 through current.

Notes:

- Spin Servers are available for each unit. Participants may need to employ multiple Spin Servers depending upon their architecture.

8 Multicast Configuration

8.1 Production Environment Configuration

8.1.1 Limitations/Configurations

The following table defines the configuration for network and gap request limitations. These limitations are session based. Cboe reserves the right to adjust the gap request limitations to improve the effectiveness of the gap request infrastructure.

Period/Type	Limit/Setting	Notes
MTU	1500	Cboe will send UDP messages up to 1500 bytes. Participants should ensure that their infrastructure is configured accordingly.
Gig-Shaped Throttle	1 Gb/s	The real-time and gap multicast head ends are configured to shape their output to this level to minimize packet loss.
Gap Response Delay	2 ms	The Gap Server will delay resending sequenced messages via multicast for the specified limit in order to satisfy multiple GRP gap requests with one multicast response.
Count	100	Any single gap request may not be for more than this number of dropped messages.
1 Second	320 Requests	This is the maximum number of retransmission requests allowed per second for each session. This is renewed every clock second.
1 Minute	1,500 Requests	This is the maximum number of retransmission requests allowed per minute for each session. This is renewed every clock minute.
Day	100,000 Requests	This is the maximum number of retransmission requests allowed per day for each session.
Within Range	1,000,000 Messages	Users' retransmission requests must be within this many messages of the most recent sequence sent by the real-time feed per session.

27	32477		
28	32478		
29	32479		
30	32480		
31	32481		
32	32482		

Note - Cboe reserves the right to add multicast addresses with prior notice, but no migration period. Notice will be given that the distribution will change on a certain date. Care should be taken to support mappings in these tables via software configuration.

9 Connectivity

9.1 Supported Extranet Carriers

Cboe has certified a number of carriers defined in the [Cboe US Equity/Options Connectivity Manual](#) with respect to redistribution of Multicast data feeds. For more information on receiving Options Multicast Top through any of these providers, reach out to the vendor contact noted in the Extranet Providers section of the Connectivity Manual.

9.2 Bandwidth Recommendation

The Gig-shaped feeds require 1 Gb/s of bandwidth. Cboe will use 90% of these respective bandwidths for Multicast Top to allow participants to use the same physical connection for order entry if desired.

10 References

For more information on Cboe Symbology, please refer to the [Cboe Symbology Reference](#) document.

11 Support
